

SPD-1E/SPD-1K/SPD-1P Owner's Manual Supplement

Playing User Samples

You can create an audio file (WAV) on your computer, and use the “12” position of the sounds knob to load that audio file into this unit and play it as a user sample (a sound that you’ve created). Just as with the built-in sounds, you can adjust the user sample’s tuning (pitch) and apply an effect to it.

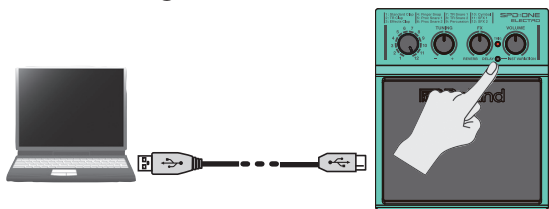

Audio files that can be played back by this unit	WAV format files, 44.1 kHz, 16-bit * If the user sample is stereo, it is automatically converted to mono.
Number of user samples	1
Length of sound	Maximum 5 seconds

Importing an Audio File

1. Prepare the audio files that you want to load into this unit.
2. Set the sounds knob to “12.”

3. While holding down the [INST VARIATION] button, use a micro-USB cable to connect this unit to your computer.

4. Open the removable disk or “SPD_ONE” that appears on your computer screen.
5. Copy the audio file that you want to import to the unit into the removable disk or “SPD_ONE.”
6. When the copy is completed, disconnect the micro-USB cable.

* Be sure to end the connection with your computer before unplugging the micro-USB cable. Unplugging the cable while your computer is processing data might cause the data to be damaged.

7. When the TRIG indicator blinks, press the [INST VARIATION] button.

The TRIG indicator blinks rapidly, and the audio file import begins.

* If the TRIG indicator does not blink rapidly, check “Audio Files This Unit Can Play,” and try the procedure again from step 3.

When the TRIG indicator stops blinking rapidly, the import is completed.
